DAYS 1-15 | READ THE SYSTEM

Earn context before changing the operating cadence.

- Shadow active accounts, founder decisions, onboarding, customization, and prototype handoffs.
- Map customer objective, AI-search visibility problem, attribution question, CRM/data environment, decision owner, and required result.
- Identify where account context currently lives and where it disappears.

OUTPUTS: account brief; current-state client-to-product map; stakeholder and decision-right map; baseline for time-to-value, handoff completeness, rework, and support burden.

DAYS 16-30 | INSTRUMENT THE WORK

Make invisible productization decisions explicit.

- Launch the Client Delta Register: shared core, legitimate delta, evidence gap, one-off exception.
- Define prototype minimums: objective, user, data, authority, failure modes, evaluation, owner, and expiry.
- Create a weekly client-to-product review with founder, product, and engineering participation.

OUTPUTS: delta register; decision log; prototype evidence standard; client/product metric set.

WEEKLY OPERATING CADENCE

- Account review - outcome, blockers, stakeholders, evidence.
- Prototype review - scope, authority, evaluation, failure modes.
- Roadmap decision - Configure / Prototype / Productize / Decline.
- Learning return - pattern, playbook, owner, next-account reuse.

Prove one loop, then make it repeatable

Operator-technologist | Client-to-product systems | Agentic workflow builder

DAYS 31-60 | PROVE ONE COMPLETE LOOP

- Select one representative enterprise request with clear value and non-trivial product learning.
- Build the smallest production-minded prototype; test data assumptions, human authority, failure behavior, and evaluation.
- Deliver the immediate client result while capturing the reusable primitive and engineering handoff.

OUTPUTS: working prototype; evaluation record; engineering handoff; learning returned to roadmap and next account.

DAYS 61-90 | MAKE THE LOOP REPEATABLE

- Convert the successful path into onboarding, customization, prototype, and handoff playbooks.
- Prioritize productization using client value, reusability, strategic fit, support burden, and confidence.
- Define what the role should automate, delegate, standardize, or stop doing as volume grows.

OUTPUTS: client-to-product playbook; evidence-ranked roadmap priorities; capacity and role-boundary view; 90-day learning memo.

90-DAY SCORECARD

CLIENT OUTCOME	Time-to-value, measurable result, adoption, executive confidence
PRODUCT LEVERAGE	Reusable primitives, multi-account applicability, roadmap confidence
OPERATING QUALITY	Handoff completeness, rework, support burden, decision clarity
LEARNING SPEED	Time from ambiguity to tested assumption and explicit disposition
