Dear Sahil and the hiring team,

The difficult part of this role is not choosing between client service and product management. It is creating an operating system where enterprise customization improves the product instead of quietly fragmenting it. That is the work I would be excited to own.

My background combines the direct operating, client-translation, and AI-enabled building capabilities this work requires. At Vape-Jet, I work across customer success, support, engineering issue flow, ERP, CRM, telemetry, production, quality, and AI-assisted workflows - turning scattered signals into prioritized work, clearer handoffs, and reusable mechanisms. Through DudeWorth, I build AI-readiness frameworks and agentic workflow patterns that connect business value, structured context, human authority, evaluation, escalation, and governance. At Amazon, I led launch and execution in a high-intensity customer-backward environment. Earlier, at Compunetics, I translated between engineering, manufacturing, quality, and high-consequence customers including DoD, CERN, Intel, and AMD.

That combination matters because the role appears to require someone who can earn client trust, decompose ambiguous requests, build a working prototype, identify what should become product, and hand engineering a decision with context rather than a vague feature request. I would bring a simple discipline: separate the shared product core from the legitimate client delta; define the evidence threshold; then make an explicit configure, prototype, productize, or decline decision.

I created a role-specific candidate vision at <https://russelldudek.github.io/TalentPluto/>. It includes the Client Delta Atlas, a 90-day entry plan, and the review mechanism I would use to turn account learning into roadmap leverage. The work is independently produced and intentionally avoids guessing the confidential partner's identity or internal operating conditions.

I would welcome a working conversation about a real client-product problem and the operating evidence you expect this hire to create in the first 90 days. I am comfortable entering ambiguity, working directly with modern AI tooling, and installing mechanisms that help a small team scale without losing judgment.

Carpe diem,

Russell Dudek
