

90-Day Entry Plan

Read the system and install one client-to-product decision record

Russell Dudek | Pittsburgh, Pennsylvania | 412.287.8640

<https://russelldudek.github.io/TalentPluto/>

DAYS 1-15

Read the account system

Earn context before changing the cadence.

- Shadow active accounts, founder decisions, onboarding, customization, prototype reviews, and engineering handoffs.
- Map the customer outcome, AI-search problem, data environment, workflow, stakeholders, decision owner, and required result.
- Identify where account context currently lives, where it is compressed, and where it disappears.

Outputs: shared account brief; current-state request-to-product map; stakeholder and decision-right map; baseline for time-to-value, handoff completeness, rework, and support burden.

DAYS 16-30

Install the Client-to-Product Translation System

Make invisible product decisions explicit.

- Introduce one request record: intent, context, constraint, smallest proof, reuse signal, and disposition.
- Define prototype minimums: user, data, authority, failure modes, evaluation, owner, expiry, and next decision.
- Establish a weekly client-to-product review with the appropriate founder, product, and engineering participation.

Outputs: request-record template; decision log; prototype evidence standard; client/product measurement categories.

Weekly operating cadence

Account context

Outcome, blockers, data, stakeholders, owner

Proof review

Scope, authority, evaluation, failure modes

Product decision

Configure / Prototype / Productize / Decline

Learning return

Primitive, playbook, rule, owner, next-account reuse

Day 30 working state

Account brief	One source for outcome, data, workflow, constraints, and owner.
Decision record	Every material request has evidence, disposition, and next decision.
Baseline visible	Time-to-value, handoff completeness, rework, and support burden.

What changes for the team

Client work	Context is captured once and reused.
Prototype work	Authority and evaluation are defined before building.
Roadmap work	Exceptions and reusable patterns are separated explicitly.

Day 30 gate: the team can trace a material request from customer outcome through context, proof standard, decision owner, and explicit product disposition.

90-Day Entry Plan

Prove one complete path, then make the learning reusable

Russell Dudek | Pittsburgh, Pennsylvania | 412.287.8640

<https://russelldudek.github.io/TalentPluto/>

DAYS 31-60

Prove one complete client-to-product loop

- Select one representative enterprise request with clear client value and non-trivial product learning.
- Build the smallest production-minded prototype; test data assumptions, human authority, failure behavior, evaluation, and adoption burden.
- Deliver the immediate client result while capturing the reusable primitive and a complete product/engineering handoff.

Outputs: working prototype; evaluation record; explicit disposition; engineering handoff; learning returned to the roadmap and next account.

DAYS 61-90

Make the learning reusable

- Convert the successful path into onboarding, configuration, prototype, and handoff patterns.
- Prioritize productization using client value, repeatability, strategic fit, support burden, confidence, and time-to-learning.
- Define what the role should automate, delegate, standardize, or stop doing as account volume grows.

Outputs: client-to-product playbook; evidence-ranked roadmap priorities; capacity and role-boundary view; 90-day learning memo.

90-day scorecard

Client outcome

Time-to-value, measurable result, adoption, executive confidence

Product leverage

Reusable primitives, multi-account applicability, roadmap confidence

Operating quality

Handoff completeness, rework, support burden, decision clarity

Learning speed

Time from ambiguity to tested assumption and explicit disposition

Scale decisions by day 90

Standardize	Repeated high-confidence paths and handoffs.
Automate	Low-risk work with clear evidence and human review.
Delegate	Stable work with explicit decision rights.
Stop	Low-leverage exceptions and unclear commitments.

Risks watched

Silent forks	Configuration becomes unsupported custom product.
Prototype debt	A demo becomes commitment without evaluation.
Context loss	Founder or client judgment never reaches the next account.

One complete proof

A real request reaches a tested result and explicit disposition.

One reusable return

A primitive, playbook, rule, or documented non-pattern.

One operating cadence

Weekly client-to-product review with named decisions.

One boundary view

What to standardize, automate, delegate, or stop.
