A request-to-product decision record

<https://russelldudek.github.io/TalentPluto/>

Parse the request before it becomes a roadmap commitment.

Preserve the customer outcome and operating context, define the smallest proof, and return the learning to the product decision.

Illustrative plan: attribution proof

CLIENT LANGUAGE	"Can you prove what AI search is changing for our pipeline?"	A defensible executive decision, not a vanity report.
INTENT	Decide where AI-search visibility is influencing pipeline.	Named business decision and owner.
CONTEXT	CRM stages, source taxonomy, visibility signals, executive owner.	Data and workflow boundaries.
CONSTRAINT	Causal claims must remain inside the available evidence.	Trust and communication boundary.
SMALLEST PROOF	Link one visibility signal to one pipeline decision with an explicit evaluation method.	Reduce uncertainty before commitment.
REUSE SIGNAL	A bounded attribution primitive that can serve multiple accounts.	Pattern, limits, and handoff criteria.
DISPOSITION	Prototype with bounded claims.	Analytics owner + product owner.

Configure

The shared product already solves the need. Bound setup and measure time-to-value.

Prototype

An important uncertainty remains. Build the smallest test that can answer it.

Productize

The need repeats, the economics work, and the evidence supports a reusable primitive.

Decline

The work has weak leverage, unsafe ambiguity, or excessive support burden.

Required inputs

- Customer outcome and decision
- Workflow and data context
- Authority and failure consequences
- Current product coverage
- Repeatability and support burden

Required outputs

- One explicit disposition
- Evidence and assumptions
- Decision owner
- Product/engineering dependencies
- Client communication
- Learning returned to the next account

Enterprise Query Plan

Weekly review and prototype handoff

Russell Dudek | Pittsburgh, Pennsylvania | 412.287.8640
russelldudek@gmail.com | linkedin.com/in/russelldudek
<https://russelldudek.github.io/TalentPluto/>

Weekly client-to-product review

10 min	15 min	15 min	10 min	10 min
Client outcomes and urgent exceptions	Patterns across requests and accounts	Prototype evidence and failure modes	Product disposition and owner	Learning return and client communication

Prototype handoff contract

- Problem and user
- Desired outcome
- Data contract
- Agent/workflow boundary
- Human authority
- Evaluation method
- Known failure modes
- Owner and next decision

Decision filters

- Client value
- Repeatability
- Strategic fit
- Evidence confidence
- Integration complexity
- Support burden
- Time-to-learning
- Reversibility

Illustrative scorecard

Dimension	Question	Measurement category
Client outcome	Did the account achieve the intended result?	Time-to-value, adoption, attributed outcome, executive confidence
Product leverage	Did the work create reusable capability?	Accounts served, configuration reuse, roadmap confidence
Operating quality	Did the handoff reduce rework?	Completeness, cycle time, recurring defects, support load
Learning speed	How quickly did uncertainty fall?	Time to tested assumption, evaluation completion, decision latency

Important boundary

This artifact is an operating hypothesis for discovery, not a claim about the confidential partner's current process. It creates a concrete interview conversation around the role's stated client, product, prototype, and scaling responsibilities.

Weekly use: review the highest-value unresolved requests, confirm evidence and owner, make one disposition, communicate the decision, and return learning to the next account.
